CCA Agar Chromogenic (ISO 9308-1)

A major revision of the ISO 9308-1 standard came into force in late 2014. This states that the TTC Agar (Chapman or Tergitol-7 Agar) is replaced by the CCA Chromogenic Agar as a culture medium for the enumeration of *Escherichia coli* and *coliform* bacteria after membrane filtration stage. The CCA is based on enzymatic reactions that give colour to the colonies of target organisms for simultaneous detection of coliforms and *E. coli*.

This medium is suitable for samples with low microbial load as drinking water, swimming pools, disinfected waters and water treatment plants at the end of the treatment.

Main advantages

- Very good recovery.
- Ideal for detection and collection of *E. coli* and coliforms in water with low contamination.
- Good colour contrast that facilitates the interpretation.
- Available in dehydrated media and 55 mm plates.

Products for microbiology

Interpretation

E. coli ► Colonies from blue to violet.
Coliforms ► Pink salmon to red.
Other bacteria (primarily Gram-negative) ► Colourless (except those with a weak glucuronidase activity but not galactosidase, producing light blue or turquoise colonies).

Technique

1. The water sample is filtered through a membrane filter of 0.45 µm pore diameter, validated according to the ISO Standard 7704:1985 (*).
2. The membrane is then placed on the surface of the CCA medium avoiding entrapment of air bubbles between the membrane and agar surface.
3. The petri dish with the membrane is incubated for 18-24 hours at 36 ± 2°C. If in 18 h there is growth of red or colourless colonies, extend the incubation until 24 h to include late reactions of β-galactosidase or β-glucuronidase.

(*) When the Chromogenic Agar for Coliform is used with the membrane filter method, the colour and growth of the colonies can be modified by the characteristics of the membrane filter. It is advisable to perform a validation of the membrane filter type used.

Composition

Enzymatic digest of casein	1.00
Yeast extract	2.00
Sodium chloride	5.00
Monosodium phosphate	2.20
Disodium phosphate	2.70

Agar	13.00
pH	6.8 ±0.2

Results

Count β-galactosidase positive colonies and β-glucuronidase negative colonies (all colonies coloured from salmon-rose to red) as Coliform bacteria different from *E. coli*.

Count β-galactosidase positive colonies and β-glucuronidase positive colonies (all colonies coloured from deep blue to violet) as *E. coli*.

Total Coliform count is obtained by the addition of the salmon-rose to red colonies plus the deep blue to violet colonies.

Calculate the concentration of Coliform bacteria and *E. coli* in 100 mL from the initial volume of water filtered and the number of characteristic colonies counted on the membrane. The results are expressed as Colony Forming Units per 100 mL (CFU/100 mL).

To confirm the *E. coli* colonies in this medium a small amount of tryptophan is included verifying indole production: Coat the blue-violet colonies with a drop of Kovacs' Reagent. If the reagent turns a cherry-red colour in a few seconds this confirms the production of indole and hence the presence of *E. coli*.

Dip Slides

PanReac AppliChem dip slides are a suitable, easy-to-use and cheap system for the Microbiological Hygiene Control of both surfaces and solutions. Each dip slide has two faces coated with agar-based medium, with a usable area of 12 cm² per face. These two faces can contain different media, thus meaning that twice as much information regarding microbial contamination can be obtained using a single device. The flexibility of the plastic strip allows samples to be taken at sites that are inaccessible to contact plates. They can also be used for the qualitative control of microbial contamination in liquids by simply immersing the dip slide in the sample.

You can store it at room temperature for up to six months. The dipslides can be used by untrained personnel due to ease of use. The results can be quantified after incubation under the indicated conditions. The dip slide range is suitable for the majority of Hygiene Control applications in both the food industry and other industrial applications.

Analytical Funnels and Microbiological Monitors

Microbiological analysis systems based on filtering for use in industries related to food, soft drinks, beer, wines, water and the pharmaceutical industry.

Analytical Funnels

The analytical funnels have a capacity of 100 mL and a removable membrane, ensuring flexibility for filtering and placing the filter on any culture medium plate.

Ideal for use in the pharmaceutical industry, particularly for monitoring of process water. Available in individual sterile container and in 0.45 microns.

Code AFW-045MC (50 units)

Monitors

The monitors are fitted with a stationary membrane next to the pad at the base of the funnel, forming an incubation unit, along with the cover. The monitors have a capacity of 100 mL and are used in combination with liquid culture medium. Ideal for use in laboratories for soft drinks, water, wines, etc.

Code FMW-045MC (50 units)

Oxidase Sticks

Contains 50 test strips used for the easy and rapid detection of the cytochrome oxidase enzyme in microbiological diagnosis. Unlike the basic laboratory test where the tetramethyl-p-phenylenediamine reagent is highly unstable, PanReac AppliChem oxidase sticks have a stabilised reagent on the pad with a greater stability.
